1 Machine Learning Engineer Nanodegree

1.1 Supervised Learning

1.2 Project 2: Building a Student Intervention System

Welcome to the second project of the Machine Learning Engineer Nanodegree! In this notebook, some template code has already been provided for you, and it will be your job to implement the additional functionality necessary to successfully complete this project. Sections that begin with **'Implementation'** in the header indicate that the following block of code will require additional functionality which you must provide. Instructions will be provided for each section and the specifics of the implementation are marked in the code block with a `'TODO'` statement. Please be sure to read the instructions carefully!

In addition to implementing code, there will be questions that you must answer which relate to the project and your implementation. Each section where you will answer a question is preceded by a **'Question X'** header. Carefully read each question and provide thorough answers in the following text boxes that begin with **'Answer:'**. Your project submission will be evaluated based on your answers to each of the questions and the implementation you provide.

Note: Code and Markdown cells can be executed using the **Shift + Enter** keyboard shortcut. In addition, Markdown cells can be edited by typically double-clicking the cell to enter edit mode.

1.2.1 Question 1 - Classification vs. Regression

Your goal for this project is to identify students who might need early intervention before they fail to graduate. Which type of supervised learning problem is this, classification or regression? Why?

Answer: It's a classification problem , because the label of the data is might need intervention or not ,this is a binary label not a number so it is a classification problem.

1.3 Exploring the Data

Run the code cell below to load necessary Python libraries and load the student data. Note that the last column from this dataset, `'passed'`, will be our target label (whether the student graduated or didn't graduate). All other columns are features about each student.

```
In [1]: # Import libraries
import numpy as np
import pandas as pd
```

```

from time import time
from sklearn.metrics import f1_score

# Read student data
student_data = pd.read_csv("student-data.csv")
print "Student data read successfully!"

```

Student data read successfully!

1.3.1 Implementation: Data Exploration

Let's begin by investigating the dataset to determine how many students we have information on, and learn about the graduation rate among these students. In the code cell below, you will need to compute the following: - The total number of students, `n_students`. - The total number of features for each student, `n_features`. - The number of those students who passed, `n_passed`. - The number of those students who failed, `n_failed`. - The graduation rate of the class, `grad_rate`, in percent (%).

```

In [2]: # TODO: Calculate number of students
n_students = student_data.shape[0]

# TODO: Calculate number of features
n_features = student_data.shape[1]

# TODO: Calculate passing students
n_passed = n_passed = student_data[student_data.passed == 'yes'].shape[0]

# TODO: Calculate failing students
n_failed = n_students - n_passed

# TODO: Calculate graduation rate
grad_rate = float(n_passed)/n_students*100

# Print the results
print "Total number of students: {}".format(n_students)
print "Number of features: {}".format(n_features)
print "Number of students who passed: {}".format(n_passed)
print "Number of students who failed: {}".format(n_failed)
print "Graduation rate of the class: {:.2f}%".format(grad_rate)

```

```

Total number of students: 395
Number of features: 31
Number of students who passed: 265
Number of students who failed: 130
Graduation rate of the class: 67.09%

```

1.4 Preparing the Data

In this section, we will prepare the data for modeling, training and testing.

1.4.1 Identify feature and target columns

It is often the case that the data you obtain contains non-numeric features. This can be a problem, as most machine learning algorithms expect numeric data to perform computations with.

Run the code cell below to separate the student data into feature and target columns to see if any features are non-numeric.

```
In [3]: # Extract feature columns
        feature_cols = list(student_data.columns[:-1])

        # Extract target column 'passed'
        target_col = student_data.columns[-1]

        # Show the list of columns
        print "Feature columns:\n{}".format(feature_cols)
        print "\nTarget column: {}".format(target_col)

        # Separate the data into feature data and target data (X_all and y_all, respectively)
        X_all = student_data[feature_cols]
        y_all = student_data[target_col]

        # Show the feature information by printing the first five rows
        print "\nFeature values:"
        print X_all.head()
```

Feature columns:

['school', 'sex', 'age', 'address', 'famsize', 'Pstatus', 'Medu', 'Fedu', 'Mjob', 'Fjob', 'health', 'address_level', 'internet', 'romantic', 'famrel', 'freetime', 'goout', 'Dalc', 'Walc', 'health_cat']

Target column: passed

Feature values:

	school	sex	age	address	famsize	Pstatus	Medu	Fedu	Mjob	Fjob	health	address_level	internet	romantic	famrel	freetime	goout	Dalc	Walc	health_cat
0	GP	F	18	U	GT3	A	4	4	at_home	teacher	1	1	no	no	4	3	4	1	1	3
1	GP	F	17	U	GT3	T	1	1	at_home	other	1	1	yes	no	5	3	3	1	1	3
2	GP	F	15	U	LE3	T	1	1	at_home	other	1	1	yes	no	4	3	2	2	3	3
3	GP	F	15	U	GT3	T	4	2	health	services	1	1	yes	yes	3	2	2	1	1	5
4	GP	F	16	U	GT3	T	3	3	other	other	1	1	yes	no	4	3	2	1	2	5
...
0	higher	internet	romantic	famrel	freetime	goout	Dalc	Walc	health
0	yes	no	no	4	3	4	1	1	3
1	yes	yes	no	5	3	3	1	1	3
2	yes	yes	no	4	3	2	2	3	3
3	yes	yes	yes	3	2	2	1	1	5
4	yes	no	no	4	3	2	1	2	5

```

absences
0         6
1         4
2        10
3         2
4         4

[5 rows x 30 columns]

```

1.4.2 Preprocess Feature Columns

As you can see, there are several non-numeric columns that need to be converted! Many of them are simply yes/no, e.g. internet. These can be reasonably converted into 1/0 (binary) values.

Other columns, like Mjob and Fjob, have more than two values, and are known as *categorical variables*. The recommended way to handle such a column is to create as many columns as possible values (e.g. Fjob_teacher, Fjob_other, Fjob_services, etc.), and assign a 1 to one of them and 0 to all others.

These generated columns are sometimes called *dummy variables*, and we will use the `pandas.get_dummies()` function to perform this transformation. Run the code cell below to perform the preprocessing routine discussed in this section.

```

In [4]: def preprocess_features(X):
        ''' Preprocesses the student data and converts non-numeric binary variables into
            binary (0/1) variables. Converts categorical variables into dummy variables.

        # Initialize new output DataFrame
        output = pd.DataFrame(index = X.index)

        # Investigate each feature column for the data
        for col, col_data in X.iteritems():

            # If data type is non-numeric, replace all yes/no values with 1/0
            if col_data.dtype == object:
                col_data = col_data.replace(['yes', 'no'], [1, 0])

            # If data type is categorical, convert to dummy variables
            if col_data.dtype == object:
                # Example: 'school' => 'school_GP' and 'school_MS'
                col_data = pd.get_dummies(col_data, prefix = col)

        # Collect the revised columns
        output = output.join(col_data)

        return output

X_all = preprocess_features(X_all)
print "Processed feature columns ({} total features):\n{}".format(len(X_all.columns),

```

Processed feature columns (48 total features):

```
['school_GP', 'school_MS', 'sex_F', 'sex_M', 'age', 'address_R', 'address_U', 'fam
```

1.4.3 Implementation: Training and Testing Data Split

So far, we have converted all *categorical* features into numeric values. For the next step, we split the data (both features and corresponding labels) into training and test sets. In the following code cell below, you will need to implement the following: - Randomly shuffle and split the data (X_{all} , y_{all}) into training and testing subsets. - Use 300 training points (approximately 75%) and 95 testing points (approximately 25%). - Set a `random_state` for the function(s) you use, if provided. - Store the results in X_{train} , X_{test} , y_{train} , and y_{test} .

```
In [5]: # TODO: Import any additional functionality you may need here
        from sklearn.model_selection import train_test_split

        # TODO: Set the number of training points
        num_train = 300

        # Set the number of testing points
        num_test = X_all.shape[0] - num_train

        # TODO: Shuffle and split the dataset into the number of training and test
        X_train, X_test, y_train, y_test = train_test_split(X_all, y_all, test_size=

        # Show the results of the split
        print "Training set has {} samples.".format(X_train.shape[0])
        print "Testing set has {} samples.".format(X_test.shape[0])
```

Training set has 300 samples.

Testing set has 95 samples.

1.5 Training and Evaluating Models

In this section, you will choose 3 supervised learning models that are appropriate for this problem and available in `scikit-learn`. You will first discuss the reasoning behind choosing these three models by considering what you know about the data and each model's strengths and weaknesses. You will then fit the model to varying sizes of training data (100 data points, 200 data points, and 300 data points) and measure the F1 score. You will need to produce three tables (one for each model) that shows the training set size, training time, prediction time, F1 score on the training set, and F1 score on the testing set.

The following supervised learning models are currently available in `scikit-learn` that you may choose from: - Gaussian Naive Bayes (GaussianNB) - Decision Trees - Ensemble Methods (Bagging, AdaBoost, Random Forest, Gradient Boosting) - K-Nearest Neighbors (KNeighbors) - Stochastic Gradient Descent (SGDC) - Support Vector Machines (SVM) - Logistic Regression

1.5.1 Question 2 - Model Application

List three supervised learning models that are appropriate for this problem. For each model chosen - Describe one real-world application in industry where the model can be applied. (You may need to do a small bit of research for this — give references!) - What are the strengths of the model; when does it perform well? - What are the weaknesses of the model; when does it perform poorly? - What makes this model a good candidate for the problem, given what you know about the data?

Answer: Decision Trees can be used in oil field, see reference as http://ardent.mit.edu/real_options/Real_opts_papers/Babajide_Thesis_FINAL.pdf The advantage of the decision trees is they are simple to understand and interpret, you can also have value even with little hard data. Calculations can get very complex particularly if many values are uncertain is their weakness. Since there isn't a large amount of data in this project, so I think a light-weighted machine learning model would be better, therefore I choose decision trees as well as ensemble methods and logistic regression. In a real industrial scenario, classification of bad accounts in credit card uses the gradient boosting model see as <http://cs229.stanford.edu/proj2014/Chengwei%20Yuan,%20Classification%20of%20Bad%20Accounts%20in%20> The strength is that even you run the model over time, testing error is still decrease, according to the udacity machine learning video. The weakness is it is more complex than decision tree and the parameters may not be tuned easily. Why I choose this model as a candidate is explained before. Logistic regression can be used in retail industry, [http://xueshu.baidu.com/s?wd=paperuri:\(69c3fd9dbc2e406d897abd473c0cbac6\)&filter=sc_long_sign&sc_us=7649060419404245118](http://xueshu.baidu.com/s?wd=paperuri:(69c3fd9dbc2e406d897abd473c0cbac6)&filter=sc_long_sign&sc_us=7649060419404245118) shows this. They can be easily interpreted and fast to train but need to transform the features if they are not linear separable.

1.5.2 Setup

Run the code cell below to initialize three helper functions which you can use for training and testing the three supervised learning models you've chosen above. The functions are as follows:

- `train_classifier` - takes as input a classifier and training data and fits the classifier to the data.
- `predict_labels` - takes as input a fit classifier, features, and a target labeling and makes predictions using the F1 score.
- `train_predict` - takes as input a classifier, and the training and testing data, and performs `train_classifier` and `predict_labels`.
- This function will report the F1 score for both the training and testing data separately.

```
In [6]: def train_classifier(clf, X_train, y_train):
        ''' Fits a classifier to the training data. '''

        # Start the clock, train the classifier, then stop the clock
        start = time()
        clf.fit(X_train, y_train)
        end = time()

        # Print the results
        print "Trained model in {:.4f} seconds".format(end - start)

def predict_labels(clf, features, target):
    ''' Makes predictions using a fit classifier based on F1 score. '''
```

```

    # Start the clock, make predictions, then stop the clock
    start = time()
    y_pred = clf.predict(features)
    end = time()

    # Print and return results
    print "Made predictions in {:.4f} seconds.".format(end - start)
    return f1_score(target.values, y_pred, pos_label='yes')

def train_predict(clf, X_train, y_train, X_test, y_test):
    ''' Train and predict using a classifier based on F1 score. '''

    # Indicate the classifier and the training set size
    print "Training a {} using a training set size of {}".format(clf, len(X_train))

    # Train the classifier
    train_classifier(clf, X_train, y_train)

    # Print the results of prediction for both training and testing
    print "F1 score for training set: {:.4f}".format(predict_labels(clf, X_train, y_train))
    print "F1 score for test set: {:.4f}".format(predict_labels(clf, X_test, y_test))

```

1.5.3 Implementation: Model Performance Metrics

With the predefined functions above, you will now import the three supervised learning models of your choice and run the `train_predict` function for each one. Remember that you will need to train and predict on each classifier for three different training set sizes: 100, 200, and 300. Hence, you should expect to have 9 different outputs below — 3 for each model using the varying training set sizes. In the following code cell, you will need to implement the following:

- Import the three supervised learning models you've discussed in the previous section.
- Initialize the three models and store them in `clf_A`, `clf_B`, and `clf_C`.
- Use a `random_state` for each model you use, if provided.
- **Note:** Use the default settings for each model — you will tune one specific model in a later section.
- Create the different training set sizes to be used to train each model.
- *Do not reshuffle and resplit the data! The new training points should be drawn from `X_train` and `y_train`.*
- Fit each model with each training set size and make predictions on the test set (9 in total).

Note: Three tables are provided after the following code cell which can be used to store your results.

```

In [7]: # TODO: Import the three supervised learning models from sklearn
from sklearn.tree import DecisionTreeClassifier
from sklearn.ensemble import GradientBoostingClassifier
from sklearn.linear_model import LogisticRegression

# TODO: Initialize the three models
clf_A = DecisionTreeClassifier(random_state=0)
clf_B = GradientBoostingClassifier(random_state=0)
clf_C = LogisticRegression(random_state=0)

```

```

# TODO: Set up the training set sizes
X_train_100 = X_train[:100]
y_train_100 = y_train[:100]

X_train_200 = X_train[:200]
y_train_200 = y_train[:200]

X_train_300 = X_train
y_train_300 = y_train

# TODO: Execute the 'train_predict' function for each classifier and each t
train_predict(clf_A, X_train_100, y_train_100, X_test, y_test)
train_predict(clf_A, X_train_200, y_train_200, X_test, y_test)
train_predict(clf_A, X_train_300, y_train_300, X_test, y_test)

train_predict(clf_B, X_train_100, y_train_100, X_test, y_test)
train_predict(clf_B, X_train_200, y_train_200, X_test, y_test)
train_predict(clf_B, X_train_300, y_train_300, X_test, y_test)

train_predict(clf_C, X_train_100, y_train_100, X_test, y_test)
train_predict(clf_C, X_train_200, y_train_200, X_test, y_test)
train_predict(clf_C, X_train_300, y_train_300, X_test, y_test)

```

```

1.5.4 Tabular Results

Edit the cell below to see how a table can be designed in [Markdown](#). You can record your results from above in the tables provided.

**** Classifier 1 - Decision Tree ****

Training Set Size	Training Time	Prediction Time (test)	F1 Score (train)	F1 Score (test)
100	0.024s	0.001s	1.0	0.6942
200	0.003s	0.001s	1.0	0.7132
300	0.003s	0.001s	1.0	0.7167

**** Classifier 2 - Gradient Boosting ****

Training Set Size	Training Time	Prediction Time (test)	F1 Score (train)	F1 Score (test)
100	0.07s	0.0s	1.0	0.7761
200	0.102s	0.001s	0.9852	0.7820
300	0.1150s	0.0s	0.9740	0.7727

**** Classifier 3 - Logistic Regression****

Training Set Size	Training Time	Prediction Time (test)	F1 Score (train)	F1 Score (test)
100	0.0s	0.0s	0.8571	0.7612
200	0.0s	0.0s	0.8380	0.7794
300	0.0s	0.0s	0.8381	0.7910

1.6 Choosing the Best Model

In this final section, you will choose from the three supervised learning models the *best* model to use on the student data. You will then perform a grid search optimization for the model over the entire training set (`x_train` and `y_train`) by tuning at least one parameter to improve upon the untuned model's F1 score.

1.6.1 Question 3 - Choosing the Best Model

Based on the experiments you performed earlier, in one to two paragraphs, explain to the board of supervisors what single model you chose as the best model. Which model is generally the most appropriate based on the available data, limited resources, cost, and performance?

Answer: Based on the experiments I performed earlier, I choose the logistic regression model as the best model. When the training set size is 300, its F1 score is highest among all three models and it trains very fast, so that I can deploy it quickly to see results and make it a good benchmark if I want to discover some other models to outperform it.

1.6.2 Question 4 - Model in Layman's Terms

In one to two paragraphs, explain to the board of directors in layman's terms how the final model chosen is supposed to work. Be sure that you are describing the major qualities of the model, such as how the model is trained and how the model makes a prediction. Avoid using advanced mathematical or technical jargon, such as describing equations or discussing the algorithm implementation.

Answer: Logistic Regression is improved from Linear Regression. For Linear Regression, target values are supposed to have only linear relationships with feature values. Since outliers may have impact on the result and its output can be greater than 1 or less than 0 even if it is used in a binary classification problem. So people came up with a new model that is Logistic Regression model, which you can interpret as enhanced linear regression model. To some extent, it decreases outliers' impact and its output is always between 0 to 1, which is good for binary classification problem.

1.6.3 Implementation: Model Tuning

Fine tune the chosen model. Use grid search (GridSearchCV) with at least one important parameter tuned with at least 3 different values. You will need to use the entire training set for this. In the code cell below, you will need to implement the following: - Import `sklearn.grid_search.gridSearchCV` and `sklearn.metrics.make_scorer`. - Create a dictionary of parameters you wish to tune for the chosen model. - Example: `parameters = {'parameter' : [list of values]}`. - Initialize the classifier you've chosen and store it in `clf`. - Create the F1 scoring function using `make_scorer` and store it in `f1_scorer`. - Set the `pos_label` parameter to the correct value! - Perform grid search on the classifier `clf` using `f1_scorer` as the scoring method, and store it in `grid_obj`. - Fit the grid search object to the training data (`X_train, y_train`), and store it in `grid_obj`.

```
In [16]: # TODO: Import 'GridSearchCV' and 'make_scorer'
import numpy
from sklearn.grid_search import GridSearchCV
from sklearn.metrics import make_scorer

# TODO: Create the parameters list you wish to tune
Cs = numpy.array([0.01,0.1,1.0,10.0])
parameters = dict(C=Cs)

# TODO: Initialize the classifier
clf = LogisticRegression(random_state=1)

# TODO: Make an f1 scoring function using 'make_scorer'
f1_scorer = make_scorer(f1_score,pos_label='yes')

# TODO: Perform grid search on the classifier using the f1_scorer as the s
grid_obj = GridSearchCV(estimator=clf,param_grid=parameters,scoring=f1_sco

# TODO: Fit the grid search object to the training data and find the optim
grid_obj = grid_obj.fit(X_train,y_train)

# Get the estimator
clf = grid_obj.best_estimator_

# Report the final F1 score for training and testing after parameter tunin
print "Tuned model has a training F1 score of {:.4f}.".format(predict_label
print "Tuned model has a testing F1 score of {:.4f}.".format(predict_label
```

Made predictions in 0.0000 seconds.

Tuned model has a training F1 score of 0.8269.

Made predictions in 0.0000 seconds.

Tuned model has a testing F1 score of 0.7838.

1.6.4 Question 5 - Final F1 Score

What is the final model's F1 score for training and testing? How does that score compare to the untuned model?

Answer: traing f1 score is 0.8269,while test f1 score is 0.7838.Its a little bit small than the previous experiment,I don't quite understand the reason.May be a little haphazard ?

Note: Once you have completed all of the code implementations and successfully answered each question above, you may finalize your work by exporting the iPython Notebook as an HTML document. You can do this by using the menu above and navigating to

File -> Download as -> HTML (.html). Include the finished document along with this notebook as your submission.
